Mausam home: actions with proof

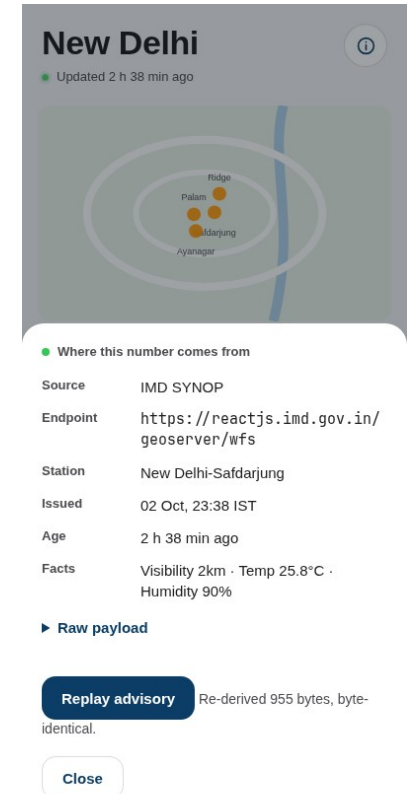

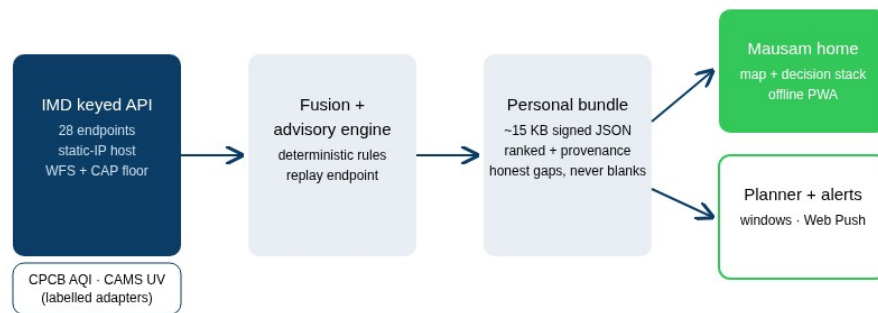

❖ Proposed Solution (Describe your Idea/Solution/Prototype)

- Decision stack on a map + bottom sheet
- Every value shows source, station and age
- Honest gaps; labelled adapters; planner

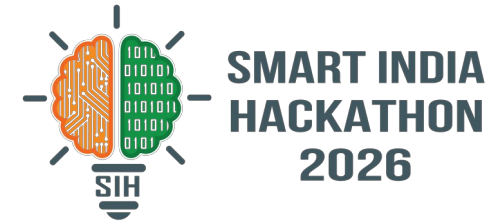

TECHNICAL APPROACH

- Vanilla PWA; offline-first, age always shown
- Deterministic engine with byte-identical replay

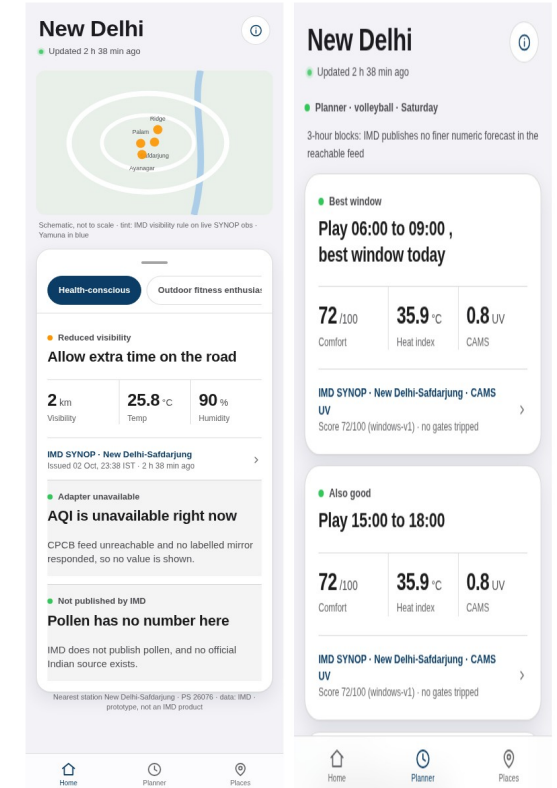

FEASIBILITY AND VIABILITY

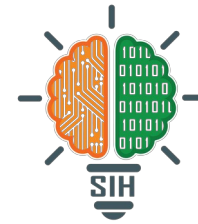

- Mock runs on real IMD captures; keyed API needs the host
- CPCB reachability, undocumented fields, iOS push limits
- Labelled fallbacks; stated grain; Android demo + inbox

IMPACT AND BENEFITS

- Actions with evidence, not bare charts
- Lineage, replay and gap cards are the moat

- IMD API reference + portal user guide (key, hourly JWT, static IP): api.imd.gov.in
- CPCB real-time AQI (GODL): data.gov.in; XKDR India Air Quality DB (CC BY 4.0)
- Copernicus CAMS atmosphere data store: ads.atmosphere.copernicus.eu
- MeitY UX4G design system; PIB Mausam note; Pai et al. 2014 rainfall climatology

- Mock, fixtures, replay tests: Mausam/app, docs/evidence
